# Smartphones enable door panel to be contactless

written by Andy Clutton | August 13, 2021

The Hero door panel line consists of a single element: a panel made of 316L stainless steel, with large steel keys and six tamper resistant torx screws, for flush mounting helping with vandal-proofing and is particularly suited to DDA applications.

Hero from Farfisa, available in the UK via [Access Security Products](#), is designed for Duo video systems with bus power supply and is ideal for large complexes, with a digital keyboard consisting of 14 large keys, backlit also in the outline of the button, backlit graphic display, wide angle camera and status icons. Hero manages up to 500 users with individual passwords, it is ready for mechanical assembly of any proximity readers and features two independent outputs: one for electric lock and one with relay for automatic gate or other lock.

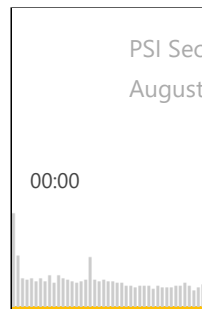

If integrated with the XE2922 board, Hero can be connected with the apps Farfisa Smart Access and Farfisa Smart Dial for contactless access control, through smartphone via Bluetooth, thus contributing to the containment of covid-19 (notouch / nocovid) contagion.

Programming can be carried out via Bluetooth, with the Duo app for iOS and Android or through integrated digital keyboard.
